The Molecular Genetics of Aging

The molecular genetics of aging or life-span determination is an expanding field. One reason is because many people would consider it desirable if human life span could be extended. Indeed, it is difficult not to be fascinated by tales of the life and death of people who have succeeded in living a very long life. Because of this, we have placed at the head of this book the chapter by Perls et al. on Centenerians and the Genetics of Longevity. Perls and his coauthors convincingly argue that, while the average life expectancy might be mostly determined by environmental factors because the average person has an average genotype, extremely long life spans are genetically determined. Of course, studying humans to uncover the genetics of aging is not ideal, not so much because one cannot easily perform experiments as because they live such a long time. This is why most of this book describes the current state of research with model organisms such as yeast, worms, flies, and mice. J aswinski focuses on yeast and how metabolic activity and stress resistance affect the longevity of *Saccharomyces cerevisiae*. In the process, he discusses the concept of aging as applied to a unicellular organism such as yeast and the importance of metabolism and stress resistance for aging in all organisms.

The Arabian Nights (or One Thousand and One Nights) is a collection of stories compiled by various authors, translators and scholars from countries across the Middle East and South Asia. The tales trace their roots back to ancient Arabia and Yemen, ancient Indian literature and Persian literature, ancient Egyptian literature and Mesopotamian mythology, ancient Syria and Asia Minor, and medieval Arabic folk stories from the Caliphate era. Though the oldest Arabic manuscript dates from the fourteenth century, scholarship generally dates the collection's genesis to somewhere between AD 800-900.
